There is a grid of $r$ rows and $c$ columns. The rows are numbered from 1 to $r$ and the columns are numbered from 1 to $c$. The upper left cell is in row 1 and column 1. The lower right cell is in row $r$ and column $c$. A cell $(p, q)$ denotes the cell in row $p$ and column $q$ in the grid. A subgrid $(r_1, c_1, r_2, c_2)$ is a part of the grid that contains all the cells from rows $r_1$ to $r_2$ and columns $c_1$ to $c_2$ (inclusive). In one unit of time you can move one marble from the cell $(p, q)$ to any of the following 4 cells: cell $(p-1, q)$, cell $(p+1, q)$, cell $(p, q-1)$, cell $(p, q+1)$. You will be given the information of a grid. Then you will be given some subgrids. For each subgrid your task is to calculate the minimum amount of time needed to move all the marbles from that subgrid to any of the cells in that subgrid.

Input
First line of the input contains an integer $T$ ($T \leq 3$) the number of test cases. Each of the test cases begins with three integers $r$, $c$ ($1 \leq r, c \leq 500$) and $q$ ($0 \leq q \leq 10000$) in one line. Here $r$ is the number of rows, $c$ is the number of columns and $q$ is the number of queries. Each of the next $r$ lines contains $c$ integers. The $j$th integer in the $i$th line contains the number of marbles in the cell $(i, j)$. All these numbers are non-negative and less than 1001. Each of the next $q$ lines contains 4 integers: $r_1$, $c_1$, $r_2$, $c_2$. These 4 integers denote the subgrid $(r_1, c_1, r_2, c_2)$. You can obviously assume that ($1 \leq r_1, r_2 \leq r$ and $1 \leq c_1, c_2 \leq c$)

Output
For each test case you have to produce $q + 1$ lines of output. The description of output for each test case is given below:

First line of each test case contains the serial of that test case. Each of the next $q$ lines contains output for one query of that test case. Output for each query contains two integers separated by a single space. The first integer denotes the serial of the query and the second integer denotes the minimum time required to move the marbles within the query subgrid to one of the cells within the subgrid.

Print a blank line after each test case.

Sample Input

2
3 4 3
1 2 3 4
5 6 7 8
9 10 11 12
1 1 3 4
1 1 2 2
1 1 3 3
3 3 3
2 1 3
4 6 1
11 2 3
1 1 3 3
1 1 2 3
2 1 3 3

Sample Output

Test Case 1:
1 118
2 9
3 66

Test Case 2:
1 45
2 16
3 27
