

## 2857 Keep on Truckin'

Boudreaux and Thibodeaux are on the road again . . .

“Boudreaux, we have to get this shipment of mudbugs to Baton Rouge by tonight!”

“Don’t worry, Thibodeaux, I already checked ahead. There are three underpasses and our 18-wheeler will fit through all of them, so just keep that motor running!”

“We’re not going to make it, I say!”

So, which is it: will there be a very messy accident on Interstate 10, or is Thibodeaux just letting the sound of his own wheels drive him crazy?

### Input

Input to this problem will consist of multiple data set. Each data set will be formatted according to the following description.

The data set will consist of a single line containing 3 numbers, separated by single spaces. Each number represents the height of a single underpass in inches. Each number will be between 0 and 300 inclusive.

### Output

There will be exactly one line of output. This line will be:

NO CRASH

if the height of the 18-wheeler is less than the height of each of the underpasses, or:

CRASH  $X$

otherwise, where  $X$  is the height of the first underpass in the data set that the 18-wheeler is unable to go under (which means its height is less than **or equal to** the height of the 18-wheeler).

The height of the 18-wheeler is **168** inches.

### Sample Input

```
180 160 170
300 300 300
```

### Sample Output

```
CRASH 160
NO CRASH
```
