Advanced Caption Machines (ACM) produces electronic captions that are used as labels, signs, and tags in various brick-and-mortar stores. They range from small tags that are used on the shelves of the stores to the large signs for the rows. Electronic captions use flip disks, electronic ink and other similar technologies to display one line of text so that this text can be electronically changed as needed. The advantage of an electronic caption is that energy is consumed only to flip the state of individual pixels. The total energy required to change displayed text to some other text is proportional to the number of pixels flipped.

ACM is mindful about nature conservation. The whole concept and marketing model of ACM’s business is built around preservation of natural resources. Without ACM’s captions stores had to print their harmful emissions. Fortunately, when one text is changed to the other text on an electronic caption, there is always a way so in the text can be laid out on a \( n \times n \) grid of pixels. The text is always written in a fixed-width font where each letter is represented by a \( m \times k \) grid of pixels. However, the spacing between the letters in a caption can vary from 1 to 2 pixels. ACM had decided to go even further and had figured out that to display a text on their electronic captions requires some electrical energy which should be conserved, too, because electrical energy is still mostly produced from non-renewable fossil fuels with their harmful emissions.

Fortunately, when one text is changed to the other text on an electronic caption, there is always a way so in the text can be laid out on a \( n \times n \) grid of pixels. The text is always written in a fixed-width font where each letter is represented by a \( m \times k \) grid of pixels. However, the spacing between the letters in a caption can vary from 1 to 2 pixels. ACM had decided to go even further and had figured out that to display a text on their electronic captions requires some electrical energy which should be conserved, too, because electrical energy is still mostly produced from non-renewable fossil fuels with their harmful emissions.

For example, the optimal way to change the text on the caption above to “NEERC” while maintaining the spacing between the letters from 1 to 2 pixels is shown below. Only 61 pixels will have to be flipped (34 pixels will be turned off and 27 pixels will be turned on).

```
...*...*..****.*...*.........*....****.*......****...
...*...*.****.*...*.........*....****..*.......
....*.*..*.....**.**.........*...*.....*...*.*.......
.....*....****.*...*.........*....****.****...****...
```

Your team is assigned with a task to write a procedure that finds the optimal caption layout for the new caption text given the text that it currently contains, so that the number of pixels to update is minimized.

**Input**

The input file contains several test cases, each of them as described below.

The first line of each case contains 5 integer numbers \( m, s, k, \text{smax}, \text{ssmax} \), where \( m (5 \leq m \leq 30) \) is the number of rows on the caption, \( n (5 \leq n \leq 2000) \) is the number of columns on the caption, \( k \leq 26 \) is the width of each letter in the font, \( \text{smax} \) and \( \text{ssmax} \) \((0 \leq \text{smax} \leq \text{ssmax} \leq 30)\) are the minimal and the maximal allowed spacing between letters in pixels correspondingly.

The following \( m \) lines of the input file contain description of the font. Each line of the font description contains \( t (k + 3) \) characters, where \( t \leq 5 \) is the number of Latin letters that are defined in this font. The grid with \( m \) rows and \( k (k + 3) \) columns on those lines is composed of \( m \times k \) grid of pixels of \( \text{smax} \) and \( \text{ssmax} \) \((0 \leq \text{smax} \leq \text{ssmax} \leq 30)\) are the minimal and the maximal allowed spacing between letters in pixels correspondingly.

The next line contains the text that is currently displayed on the electronic caption. This string has \( \text{cur} \) characters \((1 \leq \text{cur} \leq 30)\) uppercase Latin letters from A to Z. The letters that are defined appear in the current font, \( \text{cur} \) characters \((1 \leq \text{cur} \leq 30)\) uppercase Latin letters from A to Z. The letters that are defined appear in the current font.

The next line after that contains \( \text{cur} \) spaces each. Letters do not necessary appear in alphabetic order, but each letter is defined at most once.

The space character is assumed to be implicitly defined in any font as \( m \times k \) grid of ‘ ‘. The spacing between spaces and other letters is bound by the same \( \text{smax} \) and \( \text{ssmax} \) constraints, the space is treated just as a letter.

The next line contains the text that is currently displayed on the electronic caption. This string has \( \text{cur} \) characters \((1 \leq \text{cur} \leq 30)\) uppercase Latin letters from A to Z and spaces. There are no leading or trailing spaces.

The line after that contains \( \text{min} \) non-negative integer numbers. Each number defines the spacing (in pixels) before the corresponding letter or space of the currently displayed string. The first number is the spacing from the left side of the caption to the first letter, the second number is the spacing from the first letter to the second letter or space, etc. The whole string fits on the caption. The spacing for the currently displayed string does not have to obey \( \text{smax} \) and \( \text{ssmax} \) limits.

The next line contains the new text that should be displayed on the electronic caption. This string has \( \text{new} \) characters \((1 \leq \text{new} \leq 30)\) uppercase Latin letters from A to Z and spaces. There are no leading or trailing spaces.

All Latin letters that are used for the current and the new text are defined in the font description.

**Output**

For each test case, write to the output file a single line with \( \text{new} \) integers, denoting the optimal spacing for the new text. The first number is the spacing from the left side of the caption to the first letter and should be non-negative, the second number is the spacing from the first letter to the second letter or space, etc. The spacing between the letters and space characters should be between \( \text{smax} \) and \( \text{ssmax} \) inclusive. The text shall fit on the electronic caption. There is always at least one way to fit the text on the electronic caption satisfying the above constraints. If there are multiple optimal answers, write any of them.

---

**Sample Input**

```
5 53 5 1 2
A . ... . C * ** E **** I . . . * . N * * * P . R ****.
```

**Sample Output**

```
1 2
```

**ACM ICPC**

**NEERC**

**11 1**
