

6050 Primes

Let m and n be two integers, $2 \leq m < n \leq 10000000$. Consider the following set:

$$Prime(m, n) = \{p \mid p \text{ prime and } m \leq p \leq n\}.$$

Compute the cardinal of the set $Prime(m, n)$.

Input

The input consists of several tests. The input of each test is represented on a single line in the input. Any two consecutive tests are separated by an empty line. For each test, the values for m and n are given on the same line, separated by exactly one space.

Output

For each test, the result will be written to standard output on a different line (the tests will have the same order as in the input file). The results of any two consecutive tests will be separated by an empty line. For each test, the result will be the cardinal of the set $Prime(m, n)$.
