

## 6156 Sentry Robots

We need to guard a set of points of interest using sentry robots that can not move or turn. We can position a sentry at any position facing either north, south, east or west. Once a sentry is settled, it guards the points of interest that are in front of it. If two or more points are in the same row or column a single robot can guard them all. Unfortunately, there are also some obstacles that the robot cannot see through.

From a set of points of interest and obstacles lying on a grid, calculate the minimum number of robots needed to guard all the points. In order to guard a point of interest, a robot must be facing the direction of this point and must not be any obstacles in between.

Given the following grid, where # represents an obstacle and \* a point of interest, the minimum number of robots needed is 2 (a possible position and orientation is shown using arrows for each robot). Note that this is not the actual input or output, just a figure.

Grid	Solution
. . . . .	. . . . .
. * # * . .	. * # * . .
. . # . . .	. . # . . .
. * # * . .	. ↑ # ↑ . .

For the following grid we need 4 robots because of the obstacles.

Grid	Solution
. * * . .	. → * . .
. * # * .	. ↑ # ↑ .
. # * . .	. # ↓ . .
. . * . .	. . * . .

### Input

The first line of the input has an integer  $C$  representing the number of test cases that follow. Before each test case there is an empty line.

For each case, the first line has 2 integers,  $Y$  and  $X$ , representing the height and width of the grid. The next line has an integer that indicates the number of points of interest  $P$ . The following  $P$  lines will have the positions  $py$  and  $px$  of the points of interest, one point per line. The next line has an integer that indicates the number of obstacles  $W$ . The following  $W$  lines will have the positions  $wy$  and  $wx$  of an obstacle, one per line.

### Output

For each test case print the minimum number of robots needed to guard all the points of interest, one per line.

**CONSTRAINTS:**

$$1 \leq C \leq 50$$

$$1 \leq Y, X \leq 100$$

$$0 \leq P \leq Y * X$$

$$0 \leq W \leq Y * X$$

$$0 \leq P + W \leq Y * X$$

$$1 \leq px, wx \leq X$$

$$1 \leq py, wy \leq Y$$
